

ABSTRACT

Data indicating information relating to a mobile communication terminal is sent from the mobile communication terminal at a designated opportunity and the status of the mobile communication terminal is managed by a server apparatus. An AP managing server 500 sends to a mobile telephone device 600 an identifier indicating a timing for sending information relating to an application program to the AP managing server 500. When the identifier indicating the timing for sending information relating to an application program to the AP managing server 500 is received, the mobile telephone device 600 sends the information relating to the application program to the AP managing server 500 on the basis of the timing indicated by the received identifier.
